What is Serverless?

- 1. Does not require managing a long-lived host or application instance**
- 2. Self auto-scales and auto-provisions, dependent on load**
- 3. Has costs that are based on precise usage, up from and down to zero usage**
- 4. Has performance capabilities defined in terms other than host size/count**
- 5. Has implicit high availability**

Reduced cost

Fast, accurate scaling
Granular billing
Scaling to zero

Reduced risk

Managed services
Easy automation
Immutability

Shorter lead time

Lower incidental complexity

Fast deployment

Small units of deployment

Serverless has taught me...

value can be delivered

cost-effectively

safely

quickly.

Serverless **is the best way** to
realize these benefits.

Serverless *isn't the only way* to realize these benefits.

**How can we get these
benefits?**

Let's treat this system as
mostly Serverless.

**Keep in mind *how* Serverless
benefits are realized.**

This is your blueprint.

Reduced cost

Serverless	<i>Mostly Serverless</i>
Fast, accurate scaling	Best effort scaling
Granular billing	...
Scaling to zero	Infrastructure as code
Lower overhead	Automation

Reduced risk

Serverless	<i>Mostly Serverless</i>
Managed services Automation Immutable infrastructure	Managed services Automation Immutable infrastructure

Shorter lead time

Serverless	<i>Mostly Serverless</i>
Lower incidental complexity	Automation, infrastructure as code
Fast deployment	Continuous deployment
Small units of deployment	...

Mostly Serverless is as much about changing practices as technology.

This sounds a lot like DevOps.

DevOps benefits are closely aligned with Serverless benefits.

DevOps + *Mostly* Serverless =

DevOps + *Actual* Serverless =
